■Notes for the lifting capacity chart

When the outriggers are used

- 1. The lifting capacity chart indicates the maximum load which can be lifted by this crane provided it is level and standing on firm level ground. The values in the chart include the mass of the main hook and slings for boom operation, and auxiliary hook and slings for jib operation.
 - [13 ton hook (mass: 90kg), 1.8 ton hook (mass: 25kg)]
 - Within the chart the figures in the area bordered with a thick line are based on structural limitations while other figures are determined by stability limitations.
- 2. The working radii are the actual values allowing for boom and jib deflection. Therefore you must always operate the crane on the basis of working radius.
- 3. The jib working radius is based on the jib mounted on the end of the 24.0 m boom. When operating at other boom lengths, use the boom angle alone as the criterion.
- 4. Do not operate the jib when the outriggers are completely retracted.
- 5. The lifting capacities for the over sides vary with the outriggers extension width. Therefore for each outriggers extension condition you should work according the lifting capacity chart. Use the lifting capacity chart of outriggers full extension for both front and rear areas lifting capacities.

| Outrigger extension status | Intermediate extension (4.3m) | Intermediate extension (3.7m) | Intermediate extension (2.7m) | Complete retraction |
|----------------------------|-------------------------------|-------------------------------|-------------------------------|---------------------|
| Area α° | 25 | 25 | 15 | 3 |

- 6. The lifting capacity of the rooster sheave is the lifting capacity of the boom minus the mass of all attached hook, slings etc. to the boom, with an upper limit of 1,800 kg.
 - [The hook for use with the rooster sheave is the 1.8 ton hook (mass: 25kg) with one part of line.]
- 7. If the boom length, boom angle, working radius and/or jib angle exceeds the rated value, use the lifting capacity for the rated value or for the next one, whichever gives the smaller lifting capacity.
- 8. If you are working with the boom while the jib is rigged, subtract 600 kg plus the mass of all attached hook, slings, etc. to the boom from the each lifting capacity of the boom, with an upper limit of 5 ton.
 - Do not use the rooster sheave in this situation. And do not operate the boom while the jib is rigged, when the outriggers are completely retracted.
- 9. In whatever working conditions the corresponding boom critical angle is shown in the chart. The crane can tip over if the boom is lowered below the critical angle even if unloaded.
 - Therefore, never lower the boom below these angles.
- 10. The standard parts of line for each boom length are as indicated in the chart. If you work with a non-standard number of parts of line, do not exceed 15.7 kN (1.6 tf) per wire rope respectively.
- 11. High-speed lowering operation should only be performed to allow descent of the hook alone. Avoid sudden lever operation.
- 12. Crane operation is permissible up to a wind speed of 10 m/s. Even in relatively light wind conditions, extra care should be taken when handling loads presenting large wind catching areas.
- 13. If you work with a load in excess of the lifting capacity or use incorrect working procedures, you are risking damaging the crane or tipping it over. In such cases, the crane will not be guaranteed.

When the outriggers are not used

- 1. The lifting capacity chart indicates the maximum load the crane can lift when its body is level on firm level ground with all tires inflated to the rated pressure and the suspension cylinder completely retracted. The values in the chart include the mass of the main hook and slings.
 - Within the chart the figures in the area bordered with a thick line are based on structural limitations while other figures are determined by stability limitations.

[Rated tire pressure: 875 kPa (8.75 kgf/cm²)]

- 2. The working radii are the actual values allowing for boom deflection. Therefore you must always operate the crane on the basis of the working radius.
- 3. The lifting capacity differs between the front area capacity and the full range capacity. When slewing from the front to the side, take care that the crane could not be over loaded.

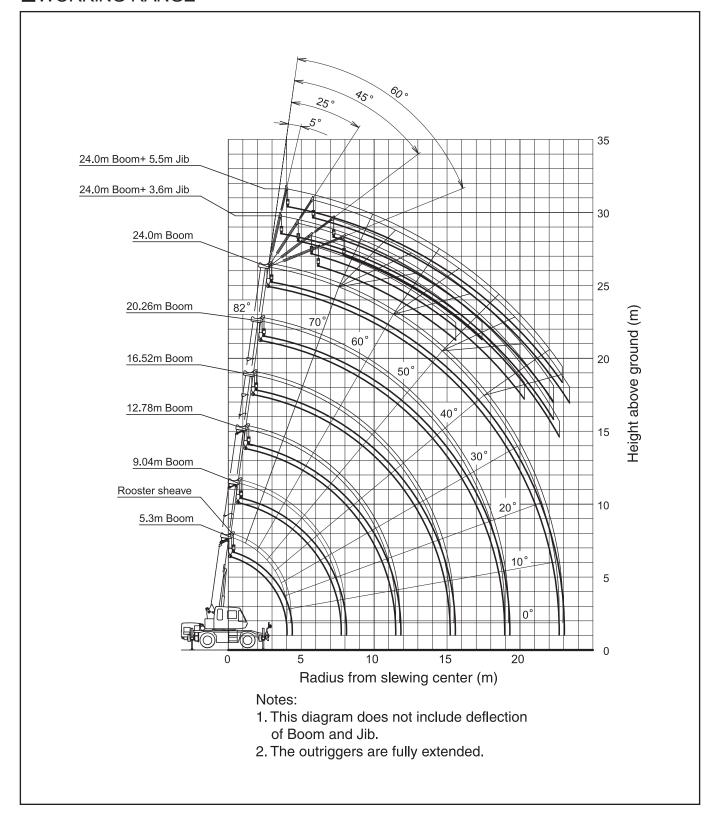

| Crane operation | Stationary crane-on-rubber operation | Pick and carry operation |
|-----------------|--------------------------------------|--------------------------|
| Area α° | 1 | 1 |

- 4. The lifting capacity of the rooster sheave is the lifting capacity of the boom minus the mass of all attached hook, slings etc. to the boom, with an upper limit of 1,800 kg.
 - [The hook for use with the rooster sheave is the 1.8 ton hook (mass: 25kg) with one part of line.]
- 5. Do not perform boom operation with a boom length of more than 12.78 m or jib operation.
- 6. For stationary crane-on-rubber operation, the parking brake and service brake lock device must be engaged.
- 7. For pick and carry operation, the shift lever must be set to speed 1.
- 8. For pick and carry operation, lower the load to just above the ground and keep your speed strictly below 2 km/h to avoid swinging the load.

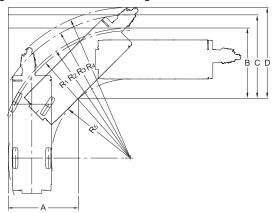

Take particular care to avoid sharp turns, sudden starts and stops.

- 9. Never operate the crane during pick and carry operation. The slewing brake must be applied.
- 10. If the boom length, boom angle and / or working radius exceeds the rated value, use the lifting capacity for the rated value or for the next one, whichever gives the smaller lifting capacity.
- 11. In whatever working conditions the corresponding boom critical angle is shown in the chart. The crane can tip over if the boom is lowered below the critical angle even if unloaded. Therefore, never lower the boom below these angles.
- 12. The standard parts of line for each boom length are as indicated in the chart. If you work with a non-standard number of parts of line, do not exceed 15.7 kN (1.6 tf) per wire rope respectively.
- 13. High-speed lowering operation should only be performed to allow descent of the hook alone. Avoid sudden lever operation.
- 14. Crane operation is permissible up to a wind speed of 10 m/s. Even in relatively light wind conditions, extra care should be taken when handling loads presenting large wind catching areas.
- 15. If you work with a load in excess of the lifting capacity or use incorrect working procedures, you are risking damaging the crane or tipping it over. In such cases, the crane will not be guaranteed.

■Minimum path width

Right turn in two-wheel steering mode

- A=3.59m (Width of entrance)

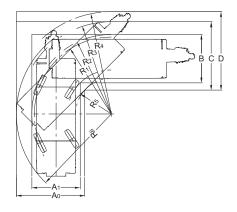

- B=3.59m (Width of wheel exit)

- C=4.26m (Width of chassis exit)

- R₁=6.50m
- (Minimum turning radius)
- R₂=6.64m
- (Turning radius of extremely \cdot D=4.65m (Width of exit at end of boom) outer tire)
- R₃=7.31m
- (Chassis turning radius)
- R₄=7.69m
- (Boom end turning radius)
- R₅=4.03m

(Turning radius extremely chassis inner)

Right turn in 4-wheel steering mode

- R₁=3.92m
- (Minimum turning radius)
- R₂=4.06m (Turning radius of
- extremely outer tire)
 R₃=4.71m
- (Chassis turning radius)
- R₄=5.22m
- (Boom end turning radius)
- R₅=1.82m
- (Turning radius extremely chassis inner)
- ∙ R₆=4.85m

(Turning radius at the rear end of the chassis)

Note: The above values are based on calculations.

- A₀=3.49m (Width of chassis entrance)

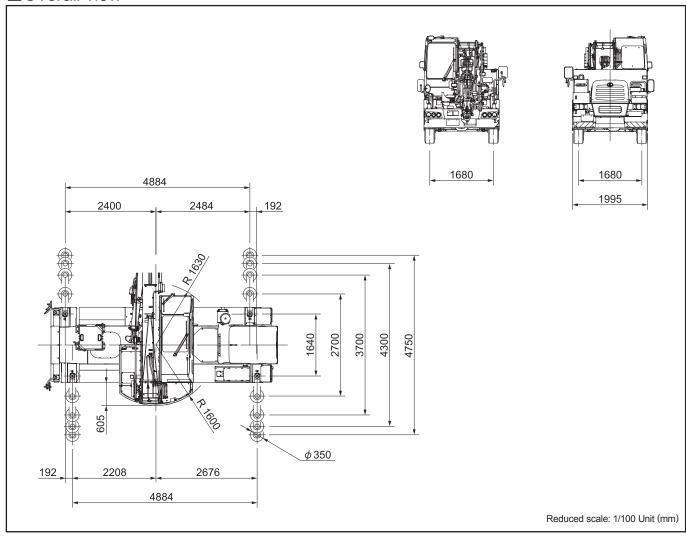

- D =4.00m (Width of exit at end of boom)

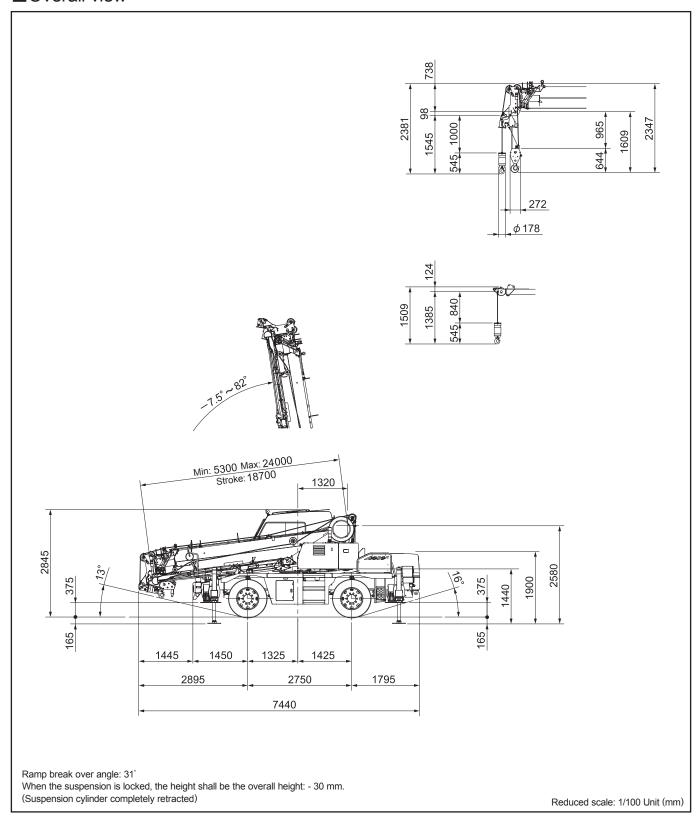

- A₁=2.47m (Width of wheel entrance)

- B =2.47m (Width of wheel exit)

- C =3.49m (Width of chassis exit)
